The counter-running Pütter bandaging technique causes very high decongestion which also reaches deep veins.

Tips for use
- After washing (up to 95°C) the bandage regains its full elasticity.

How to apply a "modified Pütter bandage"

1. Place the foot at right angle to the leg and start the first turn of the bandage at the metatarsophalangeal joints and run upwards.

2. After 2-3 turns around the foot, the bandage covers the heel and comes back to the ankle over the medial ankle.

3. With each turn, first above and then below, the edges of the first heel wrap are additionally secured. After a further turn around the midfoot, the bandage is taken back to the ankle and across the ankle joint line.

4. From the popliteal space, the bandage is wrapped once around the leg and then is followed by the shape of the leg back down, covering any gaps in the bandage.

5. The second bandage is applied in the opposite direction starting from the outside and running inwards as far as the ankle.

6. The further two turns fix first the upper end then the lower edge of the heel wrap.

7. After 2-3 turns around the midfoot, the bandage covers the heel and comes back to the instep in the same way as the first one. The completed bandage is fixed with adhesive tape on the outside of the bandage.

8. The further two turns fix first the upper end then the lower edge of the heel wrap.

9. The second bandage is applied in the opposite direction starting from the outside towards the inside of the ankle around the heel.

10. From the popliteal space, the bandage is wrapped once more around the leg, then spirally spread in order to enclose the calf and reassigned in the direction of application.

Bandages in various widths for individual use as needed.

Pütter®Flex
Comfort compression for more mobility.
Compression and comfort – No longer a contradiction.

In order to be successful, compression treatment requires the active cooperation of the patient. Therefore the ideal bandage is one which is comfortable to wear and ensures efficient compression at the same time. These properties substantially increase the chances that the patient will continue treatment until the end.

This combination of comfort and compression was, however, not always available in the past. Especially when the foot was wrapped with bandages, it often did not fit into the shoe anymore and inhibited the patient’s mobility. In addition, the pressure necessary for treatment was often found to be uncomfortable. Now there is a solution to these problems: the new PütterFlex.

A perfect fit!
Because the bandage is very thin, the wrapped foot fits better in a shoe. As a result, the treatment is better suited for daily use.

Healthy mobility
Since the ankle joint remains as mobile as possible, the patient is still able to move about freely in everyday life. In addition, the efficacy of compression treatment is enhanced because the muscular venous pump is supported by every step.

The bandage can also be worn at night due to its low resting pressure.

Since the bandage is flexible in all directions, it adapts better even to difficult areas. This makes application easier and increases wearing comfort.

The air-permeable material promotes a comfortable feeling in wear for the patient.

A perfect fit! Because the bandage is very thin, the wrapped foot fits better in a shoe. As a result, the treatment is better suited for daily use.

Effective mobility
Since the ankle joint remains as mobile as possible, the patient is still able to move about freely in everyday life. In addition, the efficacy of compression treatment is enhanced because the muscular venous pump is supported by every step.

For example Pütterflex with a HARTMANN wound dressing individually adapted to the healing phase. This highly effective treatment can be specifically adapted from case to case and makes successful treatment easier.

Benefits for the patient
- High wearing comfort
- Fits in normal shoes
- More mobility in the ankle joint
- Can be worn day and night
